RETRACTABLE PLATFORMS

- Support frames have adjustable cantilevers, which means that where units join the decks can be accurately aligned.
- Decks are fitted with lifters so that when the units are in the open position, direct contact is made through the understructure from deck to deck, thereby providing a solid structure. This also eliminates chattering and clanging between decks when the units are not fully loaded with people.
- Lower tracks are interlocked to prevent frames from drifting.
- Parallel alignment systems are fitted so as to ensure straight opening of the units.
- Each row automatically locked open as soon as the required numbers of rows are extended, the locking is automatic when closed.
- Units can be opened using manual operation, power assist or by use of integral power motors.
- Side rails are provided when required and can be either removable or self-storing.
- Our units are designed to run out over most floor surfaces, including carpet and sprung floors. Consult our office for details of limitations.
- Units can be wall attached, free standing, recessed or portable. Units below a balcony can be provided with access steps and lockable gates giving rear access to the balcony.
